Excerpt: . . . Structurally Induced Straightness Effects The two types of electroform orifice plates, pure Ni and bimetallic, would have distinctly different structurally induced straightness characteristics. With a modulus of elasticity approximately half that of steel for both Ni and Be-Cu, the load to strength ratio, W/E , would probably be close to the middle of the range evaluated. Using existing technology, the pure Ni plates would have t/d ratios less than two. A method under current develop-BeCu ment whereby the photoresist pegs can be made much longer than is currently possible would permit plates to be made with t/d ratios of up to approximately 5. In the former case, use of the pure Ni plates would be restric-Ni ted to single row configurations. In the latter case, up to 4 rows might be possible. For the bimetallic configuration, a t/d ratio of 5 probably represents a minimum, and ratios well above 10 are possible. Thus, from a structural standpoint, the bi-Figure 12: Bimetallic Electroformed metallic configuration is to be preferred since it should Orifice Geometry allow for as many rows as is desired from heat transfer considerations. Past Experience At Achieving 5 mrad Straightness This method of nozzle fabrication has been used to Hydrodynamically Induced Straightness Effects From a hydrodynamic standpoint, the shape of the produce single nozzles and nozzle arrays at Mead orifice for electroform orifice plates is probably the worst Office Systems, Xerox, IBM and other companies which met...
