Original publisher: Hampton, Va. : National Aeronautics and Space Administration, Langley Research Center, 1990 OCLC Number: (OCoLC)65174776 Excerpt: . . . the data was given by the equation 21. 2 (3. 4) Stl 0. 212 1 Reoo. D) For a Reynolds number of 80, this equation yields Stl 0. 1558. As shown in table 1, the computed values of Stl are very close to the experimental value in all cases. The largest deviation is 3. 47 and most of the values are within 2 of the experimental frequency. Therefore, the primary vortex-shedding frequency in the wake is well-predicted with either set of boundary conditions. Plots of the time history of the pressure and the resulting frequency spectrum at the selected point in the wake flow from the finite-difference calculations are shown in figure 4 for both sets of boundary conditions. The corresponding plots for the fully-spectral calculations with characteristic boundary conditions are shown in figure 5. As shown in figure 4, the solution with primitive-variable boundary conditions produces a low frequency which is not seen in the spectrum from the calculations with the...
